

## Learningworks LMS for Purolator Courier

Purolator Courier is Canada's premier courier company and offers over 200 courses to 12,000 employees coast-to-coast in both official languages.

Purolator approached Prospero to help it overcome the limitations of its existing learning management system, including: cumbersome, lengthy processes for registering learners, creating and scheduling classes, and maintaining records; the inability to track and report on ISO 9000-related learning events; and the lack of administrative controls and options in virtually all aspects of learner management.

Prospero's Learningworks LMS addressed these challenges directly with:

- A streamlined online self-registration and self-enrollment process for learners (one-click!)
- A single, central location for managing all approvals and waiting lists (also one-click!)
- Simple but flexible tools for creating and maintaining organization charts, competencies, learners, courses, and curriculums
- Classroom configuration whereby administrators can schedule new class sessions, assign learners, print roster lists, email instructions, broadcast announcements or changes, take attendance, mark learners, and send diplomas, among other things.
- Comprehensive student transcripts, as well as global reports on course results, group memberships and participation by course, student learning times and attendance, and survey results.

To facilitate implementation, Learningworks also provides Purolator with mechanisms for uploading legacy data and batches of new groups, learners, and courses.

With Learningworks, administrators have complete flexibility when assembling their courses. A course may consist of any combination of pre-requisites, pre-tests, class sessions, e-Learning content, post-tests, surveys, and evaluations – in any sequence. And any course can be bundled into a collection of courses we call “curriculums” that can be assigned to specific competencies or groups in your organization.

The Purolator Learningworks LMS also includes our testing application called Quizworks. With it, Purolator can test the knowledge of its mail sorters on 10,400 unicodes across

Canada and time their ability to identify 100 randomly selected codes in monthly quizzes.
